

Beat modern malware

Address the problem of modern malware with Optus Managed Anti-Malware Services powered by Trustwave® Secure Web Gateway (SWG).

Highlights

- Block more malware with an advanced series of behaviour analysis engines
- Minimise the burden of monitoring traffic and updating policies by opting for a managed security service
- Maximise throughput with the most efficient filtering techniques

Take malware to zero

Advanced threats call for advanced technologies and expert services. Optus Managed Anti-Malware Services powered by Trustwave can help you protect your network from zero-day threats through superior technologies, an expanded threat intelligence network and expert help to maximise your investment. Our Managed Anti-Malware Service delivers:

Patented behaviour-analysis engines

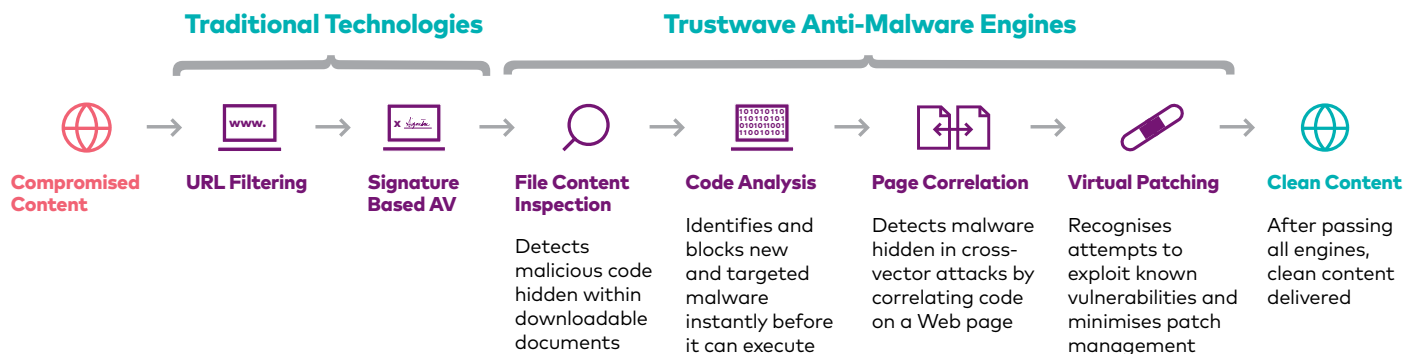

There are only a finite number of behaviours that define malware. The built-in Trustwave Malware Entrapment Engine, complemented by a series of other engines, conducts real-time code analysis that is uniquely powerful at blocking zero-day malware.

A big-data-enabled threat intelligence network

Trustwave SpiderLabs consists of forensic investigators, penetration testers and security researchers with access to vast numbers of networks, websites, endpoints, email attachments and other data streams that are analysed to quickly update the latest attack methods and behaviours for enhancing the Managed Anti-Malware Service.

Specialised managed security services

Optus and Trustwave's teams of security experts can help augment your staff to ensure you get the most from your investment. We'll help you with configuration, tuning and updating policies so that you can more efficiently maximise protection against zero-day threats. We analyse anomalies flagged by the system to proactively enhance inbound and outbound security.

A better administrator experience

By opting for a managed service, your administrator can offload the complexity and resource drain caused by running a do-it-yourself solution. Experts at Trustwave's globally federated Advanced Security Operation Centres will keep your policy up to date. The big-data backend compares behaviours across all users globally and your IT security specialist is notified when high-risk behaviour is discovered on your network. We analyse the anomalies so you don't have to.

A better user experience

Malware infections are costly, impair productivity and can damage your brand. Users just want to see their web content. The Trustwave SWG Malware Entrapment Engine exposes and blocks malware behaviour before it ever gets to the user, while passing clean content through. This delivers a better experience for your users, and relieves staff burden by reducing support calls internally.

Optus Managed Anti-Malware Service includes a powerful and clean portal to communicate with services experts, and explore trends and traffic affecting your users.
